Background:	The P.1 variant was first detected in samples from Manaus in the Amazonas state in northern Brazil in mid-December. It was detected in 42% of the samples tested and estimated that nearly 76% of the population in Manaus had already been infected with COVID-19 by October 2020. It's now highly prevalent in the Brazilian state of Amazonas, and has been detected in countries including South Korea and the United States. Mutations of concern are K417T, E484K & N501Y.
